goto bed .bed echo finished exit 0 Does any one know how to set the max number of groups for a qt ui? it seems like all the group is set to the minimum of 1. If not, does anyone know a way to group with 4 levels of tabs? Im looking for something similar to the 5 level tab system found in google reader. A: In order to have more than one tab (group) you need to set the Qt::Vertical tab bar policy to Qt::TabBarSingle: myTabBar.setTabBarPolicy(Qt::TabBarSingle); And to have four levels, use the QTabBar::tabs() method (which returns a QList of QStackedWidget items): QList tabs = myTabBar.tabs(); So you can change the contents of the tabs in this way: for (int i = 0; i < setcurrentIndex(i); } You can find an example here: An extremely important part of the invention is that no more resources need be added to the network in any instance, as the alternative of adding new nodes is always problematic from a cost point of view. It is also possible to connect any two parts of the network if it is desired. The ultrahigh frequency (UHF) radio communication links of wireless systems, also known as radio communications, radio signalling, and radio signalling, are a type of wireless telecommunications system which allows two or more users to exchange voice or data information with each other over the air. The radio communication link is the channel over which radio signals are transmitted and received. The use of UHF frequencies is to allow for better coverage of the geographical area as these frequencies are capable of covering a much wider area than conventional telephony. The quality of the radio communication link is dependent upon the nature of the terrain between the base station and the terminals. If the terrain is mountainous the quality of the link can deteriorate. The quality of the radio link can also be affected by buildings or even cars which block the signal. In a radio communication system, the signals 82157476af
